Towards generalized syzygies

Definition: Koszul homology

Let $\{a_1, \ldots, a_n\}$ be a sequence of elements in a commutative $\mathbb{C}$-algebra A. Let W be an n-dimensional complex vector space with basis $\{\theta_1, \ldots, \theta_n\}$. The **Koszul homology** of A with respect to the sequence $\{a_1, \ldots, a_n\}$ is the homology of the complex

$$A \otimes \bigwedge W,$$

where A has homological degree zero, each θ_i has homological degree one, and the **Koszul differential** is given by the formula

$$d_K = \sum_{i=1}^{n} a_i \frac{\partial}{\partial \theta_i}.$$

Koszul Algebras (I)

Definition: Quadratic algebra

Let A be a positively graded connected algebra, locally finite-dimensional. A is called **quadratic** if it is determined by a vector space of generators $V = A_1$ and subspace of quadratic relations $I \subset A_1 \otimes A_1$

Definition: Koszul quadratic dual

The **Koszul dual** algebra $A^!$ associated with a quadratic algebra A is

$$A^! = T(V^*)/I^\perp,$$

where $I^\perp \subset V^* \otimes V^*$ is the annihilator of I. Clearly $A^{!!} = A$.

Koszul algebras (II)

Definition: Koszul algebra

A quadratic as above is a **Koszul algebra** iff

$$A^! \cong \mathrm{Ext}^*_A(\mathbb{k}, \mathbb{k})$$

Lie superalgebras (I)

Definition: Lie superalgebra

A **Lie superalgebra** over $\mathbb{C}$ is a $\mathbb{Z}/2$-graded vector space (over $\mathbb{C}$) $L = L_{(0)} \oplus L_{(1)}$ with a map $[\cdot,\cdot] : L \otimes L \to L$ of $\mathbb{Z}/2$-graded spaces, satisfying:

1. (anti-symmetry) $[x, y] = -(-1)^{|x||y|}[y, x]$ for all homogeneous $x, y \in L$,
2. (Jacobi identity) $(-1)^{|x||z|}[x,[y,z]]+(-1)^{|y||x|}[y,[z,x]]+(-1)^{|z||y|}[z,[x,y]] = 0$ for all homogeneous $x, y, z \in L$.

Lie superalgebras (II)

Definition: Lie superalgebra (continued)

Here $|x|$ is the parity of x: $|x| = i$ when $x \in L_{(i)}$ for $i = 0, 1$. An element x in $L_{(0)}$ or $L_{(1)}$ is termed even or odd respectively. We recover the familiar definition of a Lie algebra (over $\mathbb{C}$) in the case $L = L_{(0)}$.

Definition: graded Lie superalgebra

A **graded Lie superalgebra** is a Lie superalgebra L together with a grading compatible with the bracket and supergrading. That is, $L = \bigoplus_{m \geq 1} L_m$ such that $[L_i, L_j] \subset L_{i+j}$ and $L_{(i)} = \bigoplus_{m \geq 1} L_{2m-i}$ for $i = 0, 1$.

Koszul dual as universal envelope

Koszul dual as universal envelope

Assume that $A = T(V)/I$ is commutative, hence $\bigwedge^2 V \subset I$. Therefore $I^\perp$ is contained in $S^2(V^*)$, and so is generated by certain linear combinations of anti-commutators $[a_i^*, a_j^*] = a_i^* a_j^* + a_j^* a_i^*$. As a consequence, the Koszul quadratic dual of A can be described as the universal envelope of a graded Lie superalgebra,

$$A^! = U(L), \qquad L = \bigoplus_{m \geq 1} L_m = \mathbb{L}(V^*)/J, \tag{1}$$

where $\mathbb{L}$ is the free Lie superalgebra functor, the space of (odd) generators V^* is concentrated in degree 1, and J is the Lie ideal with the same generators as $I^\perp$ but viewed as linear combinations of supercommutators.

Some Lie ideals

The following Lie ideals are main characters of our work.

Definition

For $k \geq 2$, we define the graded Lie superalgebras

$$L_{\geq k} = \bigoplus_{m \geq k} L_m.$$

The algebra of syzygies (I)

Definition: the algebra of syzygies

Let A be a commutative $\mathbb{C}$-algebra which is a module over $S(V)$, and suppose we have a minimal free resolution of A,

$$\cdots \to F_2 \to F_1 \to F_0 \to A \to 0.$$

This is an exact sequence of graded free $S(V)$-modules,

$$F_p = \bigoplus_{q \geq m_p} R_{pq} \otimes S(V),$$

where R_{pq} is the finite dimensional vector spaces of p**-th order syzygies of degree** q for A, and m_p is the minimum degree among the p-th order syzygies.

The algebra of syzygies (II)

Syzygies and the Koszul complex

- Since the chosen resolution is minimal, the differential vanishes on tensoring this complex with the trivial $S(V)$-module $\mathbb{C}$.
- Hence

$$\mathrm{Tor}_p^{S(V)}(A, \mathbb{C}) \;=\; R_p := \bigoplus_{q \geq m_p} R_{pq}.$$

The algebra of syzygies (III)

- The functor $\mathrm{Tor}^{S(V)}$ may also be calculated by resolving the other argument $\mathbb{C}$.
- The Koszul complex $K(S(V))$ of the symmetric algebra $S(V) = \mathbb{C}[a_1, \ldots, a_n]$, is given by $(S(V) \otimes \bigwedge W,\, d_K)$, that is,

$$(\mathbb{C}[a_1, \ldots, a_n] \otimes \bigwedge(\theta_1, \ldots, \theta_n),\, d_K). \tag{2}$$

with the Koszul differential d_K of the sequence $\{a_1, \ldots, a_n\}$.

The algebra of syzygies (IV)

Since this complex is a resolution of $\mathbb{C}$ we can calculate the syzygies R_p of the quadratic algebra $A = T(V)/I$ by the homology of the complex

$$A \otimes_{S(V)} K(S(V)) = A \otimes_{S(V)} S(V) \otimes_{\mathbb{C}} \bigwedge W = A \otimes \bigwedge W. \tag{3}$$

This homology inherits a multiplication from $K(S(V))$ and becomes an associative algebra.

Lie ideals and the algebra of syzygies

- $H^*(L_{\geq 2}, \mathbb{C})$ gives indeed the algebra of syzygies of A.
- The interpretation of the algebras $L_{\geq k}$ for $k > 2$ was outlined by Berkovits in [4].
- We concentrate on the case $k = 3$.

Introduction: Berkovits' example

- In his work on string quantization and string/gauge theory duality [4], Berkovits uses crucially Koszul duality theory for commutative algebras.
- There, the coordinate algebra of the orthogonal Grassmannian $A = OGr(5, 10)$, related to the spinor representation of the group $SO(10, \mathbb{C})$ is considered.
- This algebra A is quadratic, and hence we know that its Koszul dual $A^!$ is $U(L)$ the universal enveloping algebra of a certain (graded) Lie superalgebra $L = \bigoplus_{i\geq 1} L_i$.

[4] Berkovits, N.; *Cohomology in the pure spinor formalism for the superstring*, J. High Energy Phys. 9 (2000).

- Berkovits' first observation, made in the context of string and gauge theories, was that the algebra of syzygies of A is isomorphic to the cohomology $H^*(L_{\geq 2}, \mathbb{C})$ of the Lie superalgebra $L_{\geq 2} = \bigoplus_{i \geq 2} L_i$.
- He proposed an extension of the Koszul complex of the coordinate algebra of $OGr(5, 10)$, relevant for his quantization procedure, and considered the question of calculating its homology.

- This extension is worthy of study for more general algebras.
- Berkovits' construction is an iteration of the Koszul homology of a sequence of elements of an algebra, first applied to the algebra A and then applied to its syzygies.
- As we recalled there is a notion of Koszul homology with respect to a sequence of elements $\{a_1, .., a_n\}$ of a commutative algebra A.
- And we recalled as well that if A is finitely generated and presented as $\mathbb{C}[a_1, ..., a_n]/I$, the Koszul homology with respect to the sequence $\{a_i\}$ gives the algebra of syzygies of A.

- The generators Γ_j of the ideal I represent syzygies in the lowest degree.
- The Koszul homology of the algebra of syzygies with respect to the sequence Γ_j is the homology studied by Berkovits. This is what we call the algebra of generalized syzygies.
- It turns out that if A is Koszul, the generalized syzygies can also be described explicitly in terms of the Lie superalgebra L. This was shown by Movshev and Schwarz in [12] for the case of the coordinate algebra of the $OGr(5, 10)$.
- There was proved that in that case the homology of the Berkovits complex is isomorphic to the cohomology $H^*(L_{\geq 3}, \mathbb{C})$ of the Lie superalgebra $L_{\geq 3} = \bigoplus_{i \geq 3} L_i$.

[12] Movshev, M.; Schwarz, A.; *On maximally supersymmetric Yang-Mills theories*, Nuclear Physics B 681 (2004)

- Our aim is to extend these statements about $H^*(L_{\geq 3}, \mathbb{C})$ from the coordinate algebra of the orthogonal Grassmannian to an arbitrary finitely generated commutative Koszul algebra.
- Further examples are supplied by the orbits of the highest weight vector in an irreducible representation of a semisimple complex Lie group, as studied by Gorodentsev, Khoroshkin and Rudakov [9].
- We prove in our Main Theorem that the cohomology of the Lie algebra $L_{\geq 3}$ is isomorphic to the Berkovits homology of A.

---

[9] Gorodentsev, A.; Khoroshkin, A.; Rudakov A.; *On syzygies of highest weight orbits*, Amer. Math. Soc. Transl. 221 (2007).

- Since A is finitely generated, Hilbert's syzygy theorem says that the algebra of syzygies of A is finite dimensional.
- We expect the Lie superalgebra $L_{\geq k} \subset L_{\geq 3}$ to be a free Lie superalgebra for some k.
- Movshev and Schwarz, in [12], proved that $L_{\geq 3}$ is a free Lie superalgebra on an infinite set of generators in the case of the coordinate algebra of pure spinors.
- From the point of view of the gauge theory, freeness of $L_{\geq k}$ is important because it implies that the solution to the Euler-Lagrange equations for an abelian gauge group can be deformed to the solutions for a non-abelian gauge group.

- A commutative Koszul algebra A has a nice resolution in the category of algebras, given by the Chevalley complex of the Lie superalgebra L.
- Our main idea is to lift the Koszul differential which calculates the generalized syzygies to this resolution and subsequently calculate its homology.
- This requires a correction term to the naively lifted differential to guarantee that the lift squares to zero.
- This makes heavy use of the homological perturbation lemma à la Barnes and Lambe [3].

[3] Barnes, D.; Lambe, L.; *A fixed point approach to homological perturbation theory*, Proc. Amer. Math. Soc. 112 (1991), no. 3, 881–892.

Berkovits homology or generalized syzygies

Main Theorem

The algebra of generalized syzygies of a commutative Koszul algebra A is isomorphic to $H^*(L_{\geq 3}, \mathbb{C})$.

A result on DG algebras

Key Lemma

Let (C, d) be a commutative DG algebra over $\mathbb{C}$, nonnegatively graded and finitely generated in each degree. Let B be a contractible DG subalgebra of C, with quasi-isomorphism $\varepsilon : B \to \mathbb{C}$, and consider the DG ideal $\langle \overline{B} \rangle$ of C generated by the augmentation ideal $\overline{B} = \ker(\varepsilon)$. If $\langle \overline{B} \rangle$ is freely generated as a $\overline{B}$-module by a graded basis of homogeneous elements $Z = \bigcup_{i \geq 0} Z_i$, then C is quasi-isomorphic to $C/\langle \overline{B} \rangle$.

The Chevalley complex

Assume that A is a commutative Koszul algebra with $A^! = U(L)$ as above. We construct a resolution of A in the category of DG algebras from the Chevalley complex of L.

Definition: the Chevalley complex

The **Chevalley complex** of L is the cochain complex with

$$\mathrm{Ch}^i(L) = \left(\bigwedge^i L\right)^*$$

and the differential $d_C : \mathrm{Ch}^k(L) \to \mathrm{Ch}^{k+1}(L)$

$$(d_C\varphi)(x_0, \ldots, x_k) = \sum_{i<j} (-1)^{j+\varepsilon(i,j)} \varphi(x_0, \ldots, x_{i-1}, [x_i, x_j], x_{i+1}, \ldots, \widehat{x_j}, \ldots, x_k)$$

Some properties of the Chevalley complex

- $d_C : \mathrm{Ch}^1(L) \to \mathrm{Ch}^2(L)$ is the map that is dual to the bracket,

$$(d_C f)(x_0, x_1) = -f[x_0, x_1].$$

- The Chevalley complex is a cochain complex that calculates the cohomology of L with trivial coefficients, $H^*(L, \mathbb{C})$.
- This complex admits an algebra structure that descends to one on the cohomology of L so that the differential d_C is a derivation with respect to its product.
  That is, given $\varphi \in \left(\bigwedge^i L\right)^*$ and $\psi \in \left(\bigwedge^j L\right)^*$,
  $\varphi \odot \psi \in \left(\bigwedge^{i+j} L\right)^*$ and $d_C(\varphi \odot \psi) = d_C\varphi \odot \psi \pm \varphi \odot d_C\psi$.

The Chevalley complex as a chain complex

- As well as being a cochain complex whose cohomology is that of L, the Chevalley complex may also be considered a chain complex which defines a resolution of A.
- The chain complex is given by defining L_p^* to have homological grading $p-1$, so that the homological and cohomological gradings together give the total degree in $\bigwedge L^*$.

The Chevalley complex as a chain complex (II)

We illustrate the Chevalley complex as a chain complex with homological grading as follows:

$$\mathrm{Ch}_3(L) \xrightarrow{d_C} \mathrm{Ch}_2(L) \xrightarrow{d_C} \mathrm{Ch}_1(L) \xrightarrow{d_C} \mathrm{Ch}_0(L) \longrightarrow 0$$

$$0 \longrightarrow L_1^* \longrightarrow 0$$

$$0 \longrightarrow L_2^* \longrightarrow \bigwedge^2 L_1^* \longrightarrow 0$$

$$0 \longrightarrow L_3^* \longrightarrow L_2^* \wedge L_1^* \longrightarrow \bigwedge^3 L_1^* \longrightarrow 0$$

The original cohomological grading is seen on the diagonals.

The Chevalley complex as resolution

In our situation of a graded Lie superalgebra L with $A^! = U(L)$ we observe that

$$\mathrm{Ch}_0(L) = \bigwedge L_1^* = S(V).$$

Proposition

For a commutative Koszul algebra A with $A^! = U(L)$, the chain complex given by the Chevalley complex of L with homological grading is a resolution of A.

The Chevalley complex as resolution (II)

Proof of proposition

The Chevalley complex of L with cohomological degree given by the number of exterior powers calculates

$$H^i(L, \mathbb{C})_j \cong \mathrm{Ext}^{ij}_{U(L)}(\mathbb{C}, \mathbb{C}).$$

Since A is a commutative Koszul algebra, we have

$$A = \bigoplus_{i \geq 0} \mathrm{Ext}^{ii}_{A^!}(\mathbb{C}, \mathbb{C})$$

and $\mathrm{Ext}^{ij}_{A^!}(\mathbb{C}, \mathbb{C}) = 0$ for $i \neq j$

Chevalley complex as resolution (III)

Proof (continued)

But $A^! = U(L)$ and

$$H_i(\mathrm{Ch}(L))_j = H^{j-i}(L, \mathbb{C})_j,$$

where on the left hand side we are using our homological grading of $\mathrm{Ch}(L)$. Therefore,

$$H_i(\mathrm{Ch}(L)) = \begin{cases} A & \text{if } i = 0 \\ 0 & \text{if } i \neq 0 \end{cases}$$

and the Chevalley complex of L is a resolution of A.

Cohomology of $L_{\geq 2}$

Theorem

Let $A = T(V)/I$ be a commutative Koszul algebra, $R = \oplus_p R_p$ is its algebra of syzygies and $A^! := T(V^*)/I^\perp = U(L)$ is its Koszul dual. Then $R_{pq} \cong H^{q-p}(L_{\geq 2}, \mathbb{C})_q$ as algebras.

Idea of proof

- Denote by X the tensor product $\mathrm{Ch}(L) \otimes \bigwedge W$ with generators of W in degree one.
- Consider the differential $d_C + d_K$ on X, which one can check makes this into a complex.
- We put an algebra structure on the complex X by the following rule: if $\alpha, \beta \in \mathrm{Ch}(L)$ and $\eta, \xi \in \bigwedge W$, then

$$(\alpha \otimes \eta) \cdot (\beta \otimes \xi) := (-1)^{|\eta||\beta|} \alpha \wedge \beta \otimes \eta \wedge \xi.$$

Idea of proof continued

- Since $\mathrm{Ch}_0(L) = S(V)$, this implies that $K(S(V)) = \mathrm{Ch}_0(L) \otimes \bigwedge W$ is a subalgebra in X.
- The restriction of the differential to this subalgebra is d_K, and hence is a resolution of $\mathbb{C}$.
- This satisfies the conditions of Key Lemma above and X is quasi-isomorphic to $X/\langle\overline{K(S(V))}\rangle$, where $\langle\overline{K(S(V))}\rangle$ is the DG ideal in X generated by the augmentation ideal of $K(S(V))$. Hence, $H_i(X) = H_i(X/\langle\overline{K(S(V))}\rangle) = H_i(\mathrm{Ch}(L_{\geq 2}))$, as $\mathrm{Ch}_0(L) = \mathrm{Ch}(L_1)$.

Idea of proof continued

- Now, consider the following filtration of X

$$\{0\} \subset F_0X \subset F_1X \subset \cdots \subset F_nX \subset \dots,$$

given by

$$F_pX_q := \sum_{j \leq p} \sum_{i+j=p+q} \mathrm{Ch}_i(L) \otimes \bigwedge^j W.$$

- The differential on the E_0-term of the spectral sequence associated to this filtration is d_C. Since $\bigwedge W$ is a vector space over $\mathbb{C}$, it is flat as a $\mathbb{C}$-module. Further, $\mathrm{Ch}(L)$ is a resolution for A.
- We can conclude that the E_1-term of the spectral sequence is contained in one line given by $A \otimes \bigwedge W$ with differential d_K.
- Hence, $R_i \cong H_i(X)$.

Idea of proof ended

- It is clear that both interpretations of the homology respect the multiplicative structure: $X/\langle\overline{K(S(V))}\rangle$ inherits its multiplicative structure from X and the spectral sequence will also respect it.
- The Chevalley complex $\mathrm{Ch}(L)$ calculates the cohomology of Lie superalgebra L, where the cohomological grading of $\mathrm{Ch}(L)$ is given by the number of exterior powers.
- Therefore, $R_{pq} = H_p(X)_q = H_p(\mathrm{Ch}(L_{\geq 2}))_q = H^{q-p}(L_{\geq 2}, \mathbb{C})_q$.

Berkovits Complex

Let $A = \mathbb{C}[a_1, \ldots, a_n]/I$ be commutative Koszul, with minimal set of generators $\{\Gamma_1, \ldots, \Gamma_m\}$ of I representing lowest degree syzygies.

Lemma

If the quadratic relations for A are defined by the formulas

$$\Gamma_k = \sum_{i,j=1}^{n} \Gamma_{ij}^k a_i a_j,$$

for $k = 1, \ldots, m$, then the representative for the homology class in the algebra of syzygies defined by the sequence $\{\Gamma_1, \ldots, \Gamma_m\}$ is

$$\tilde{\Gamma}_k = \sum_{i,j=1}^{n} \Gamma_{ij}^k a_i \theta_j, \qquad k = 1, \ldots, m$$

Berkovits complex (II)

Definition

The **Berkovits complex** of a commutative Koszul algebra A is

$$A \otimes \bigwedge(\theta_1, \dots, \theta_n) \otimes \mathbb{C}[y_1, \dots, y_m]$$

equipped with the **Berkovits differential**

$$d_B = d_K + d_{Ber} = \sum_{i=1}^{n} a_i \frac{\partial}{\partial \theta_i} + \sum_{k=1}^{m} \sum_{i,j=1}^{n} \Gamma_{ij}^k a_i \theta_j \frac{\partial}{\partial y_k},$$

where the y_k have homological degree two.
(One can prove that $d_B^2 = 0$).

Lifting the differential

The setup

As before $L = \bigoplus L_i$ where $U(L) = A^!$. The vector space L_2 has the same dimension as $S^2(V^*)/I^\perp \cong I^*$ and the generators of I are linearly independent, so we have a basis $\{q_1, \ldots, q_m\}$ of L_2^* such that

$$q_k = \sum_{i,j=1}^{n} \Gamma_{ij}^k \{a_i, a_j\},$$

and by construction,

$$d_C(q_k) = \sum_{i,j=1}^{n} \Gamma_{ij}^k a_i a_j$$

for $k = 1, \ldots, m$.

Lifting the differential (II)

The idea

Define Y as:

$$\mathrm{Ch}(L) \otimes \bigwedge(\theta_1, \ldots, \theta_n) \otimes \mathbb{C}[y_1, \ldots, y_m],$$

with an obvious graded algebra structure.
We can try to lift the Berkovits differential to Y as follows:
$d_C + d_K + d_{Ber}$ where

$$d_{Ber} = \sum_{i,j=1}^{n} \sum_{k=1}^{m} \Gamma_{ij}^{k} a_i \theta_j \frac{\partial}{\partial y_k}.$$

However, one checks that

$$(d_C + d_K + d_{Ber})^2 = \sum_{i,j=1}^{n} \sum_{k=1}^{m} \Gamma_{ij}^{k} a_i a_j \frac{\partial}{\partial y_k} \neq 0.$$

In order for the differential to square to zero, we define a correction to the differential as

$$d_S = -\sum_{k=1}^{m} q_k \frac{\partial}{\partial y_k}.$$

Proposition

$$(d_C + d_K + d_{Ber} + d_S)^2 = 0.$$

$$d_K d_S + d_S d_K = d_{Ber} d_S + d_S d_{Ber} = d_S^2 = 0,$$

and

$$d_C d_S + d_S d_C = -\sum_{i,j=1}^{n} \sum_{k=1}^{m} \Gamma_{ij}^k a_i a_j \frac{\partial}{\partial y_k} + \sum_{k=1}^{m} q_k \frac{\partial}{\partial y_k} d_C - \sum_{k=1}^{m} q_k \frac{\partial}{\partial y_k} d_C.$$

Therefore,

$$(d_C + d_K + d_{Ber} + d_S)^2 = (d_C + d_K + d_{Ber})^2 - \sum_{i,j=1}^{n} \sum_{k=1}^{m} \Gamma_{ij}^k a_i a_j \frac{\partial}{\partial y_k} = 0.$$

The Resolution of $\mathbb{C}$ inside Y

Proposition

The subalgebra T of Y given by:

$$\mathrm{Ch}(L_1, L_2) \otimes \bigwedge(\theta_1, \ldots, \theta_n) \otimes \mathbb{C}[y_1, \ldots, y_m]$$

is a resolution of $\mathbb{C}$.

This subcomplex is equipped with the differential

$$\sum_{i=1}^{n} a_i \frac{\partial}{\partial \theta_i} + \sum_{k=1}^{m} \left(\sum_{i,j=1}^{n} \Gamma_{ij}^{k} a_i \theta_j - q_k \right) \frac{\partial}{\partial y_k} + \sum_{k=1}^{m} \sum_{i,j=1}^{n} \Gamma_{ij}^{k} a_i a_j \frac{\partial}{\partial q_k}.$$

Idea of the proof

Step 1

The Koszul complex (P, d_K) of the sequence $\theta_1, \ldots, \theta_n$ in $\mathrm{Ch}(L_1)$ and the Koszul complex (Q, d_S) of $y_1, \ldots, y_m$ in $\mathrm{Ch}(L_2)$ are contractible, as is the product $(P \otimes Q, d_K + d_S)$.

Step 2

We perturb the differential on $P \otimes Q$ to the differential on T by using the homological perturbation lemma of [3].

Step 3

The perturbed homotopy is well-defined, so T has a strong deformation retraction to $(\mathbb{C}, 0)$ concentrated in degree zero.

Step 1

Lemma

The complexes (P, d_K) and (Q, d_S) are contractible.
In fact, there are strong deformation retractions

$$\varphi_K \circlearrowright \mathbb{C}[a_1, \ldots, a_n] \otimes \bigwedge(\theta_1, \ldots, \theta_n) \underset{\iota}{\overset{\epsilon}{\rightleftarrows}} \mathbb{C}$$

$$\varphi_S \circlearrowright \bigwedge(q_1, \ldots, q_m) \otimes \mathbb{C}[y_1, \ldots, y_m] \underset{\iota}{\overset{\epsilon}{\rightleftarrows}} \mathbb{C}$$

where the right hand side is concentrated in degree zero, with trivial differential.
The same is true for the complex $(P \otimes Q, d_K + d_S)$.

Step 2

However, $\partial = d_K + d_S$ is not the differential we are interested in; we want to consider instead the complex with a perturbed differential,

$$(P \otimes Q, \partial + \partial').$$

Here ∂' is given by $d_C + d_{Ber}$,

$$\sum_{k=1}^{m} \sum_{i,j=1}^{n} \Gamma_{ij}^{k} a_i \theta_j \frac{\partial}{\partial y_k} + \Gamma_{ij}^{k} a_i a_j \frac{\partial}{\partial q_k}.$$

Then the complex is precisely T.

Step 2 continued

In order to show the complex with the new differential is also contractible we apply the homological perturbation lemma (see for example [3]). This says there is a unique perturbation of the deformation retraction

$$\varphi \circlearrowright (P \otimes Q, \partial) \underset{\iota}{\overset{\epsilon}{\rightleftarrows}} \mathbb{C}$$

to a deformation retraction

$$\varphi' \circlearrowright (P \otimes Q, \partial + \partial') \underset{\iota}{\overset{\epsilon}{\rightleftarrows}} \mathbb{C}$$

if and only if the original contracting homotopy φ and the perturbation of the differential ∂' satisfy a local nilpotence condition.

Step 2 ended

That is, for each element γ the expression

$$(\partial'\varphi)^N(\gamma)$$

is zero for sufficiently large $N = N(\gamma)$. In this case

$$\varphi\left(\sum_{n=0}^{\infty}(\partial'\varphi)^n\right)$$

is well-defined and will be the required contracting homotopy φ'.

Step 3

We proceed to prove the local nilpotency condition required.

Suppose $\alpha \otimes \beta \in P \otimes Q$ with $\beta \in \bigwedge^{\leq s}(q_1, \dots, q_m) \otimes \mathbb{C}[y_1, \dots, y_m]$. If $s = 0$ then $\partial' \varphi(\alpha \otimes \beta) = 0$, and if $s > 0$ then

$$\partial' \varphi(\alpha \otimes \beta) \quad \in \quad P \otimes \bigwedge^{\leq (s-1)}(q_1, \dots, q_m) \otimes \mathbb{C}[y_1, \dots, y_m]$$

Hence $(\partial' \varphi)^{m+1} = 0$.

Generalized syzygies

Main Theorem

Let A be a commutative Koszul algebra and $A^! = U(L)$. Then,

$$H^*_{Ber}(A) \cong H^*(L_{\geq 3}, \mathbb{C}).$$

Idea of proof

- We have that T is a subalgebra in Y.
- We showed in a Proposition above that T is a resolution of $\mathbb{C}$. This satisfies the conditions of the Key Lemma and Y is quasi-isomorphic to $Y/\langle\overline{T}\rangle$, where $\langle\overline{T}\rangle$ is the DG ideal in Y generated by the augmentation ideal of T. Hence, $H_i(Y) = H_i(Y/\langle\overline{T}\rangle) = H_i(\mathrm{Ch}(L_{\geq 3}))$.

Idea of proof, continued

- Now, consider the filtration of X

$$\{0\} \subset F_0X \subset F_1X \subset \cdots \subset F_nX \subset \ldots,$$

given by

$$F_pY_q := \sum_{j\leq p} \sum_{i+j=p+q} \mathrm{Ch}_i(L) \otimes \left(\bigwedge(\theta_1, \ldots, \theta_n) \otimes \mathbb{C}[y_1, \ldots, y_m] \right)_j .$$

- The differential on the E_0-term of the spectral sequence associated to this filtration is d_C.
- Since, $\bigwedge(\theta_1, \ldots, \theta_n) \otimes \mathbb{C}[y_1, \ldots, y_m]$ is a vector space over $\mathbb{C}$, it is flat as a $\mathbb{C}$-module.

Idea of proof, ended

- As $\mathrm{Ch}(L)$ is a resolution for A, we can conclude that the E_1-term of the spectral sequence is contained in one line and is given by,

$$A \otimes \bigwedge(\theta_1, \ldots, \theta_n) \otimes \mathbb{C}[y_1, \ldots, y_m]$$

  with precisely the Berkovits differential.
- Hence, the homology of this complex is also $H^*_{Ber}(A)$.
- The result follows by converting the grading to the cohomological grading of the Chevalley complex.
